RangeIndex: 858 entries, 0 to 857
Data columns (total 36 columns):

Propping

26 out of (6 columns have rusting values but since 'STDs: Time since first diagnosis' and 'STDs: Time since last diagnosis' columns have % 91.7 missing values, we are going to drop off these columns.

```
1 df.drop(['STDs: Time since first diagnosis', 'STDs: Time since last diagnosis'], axis =1 , inplace = True)
```

The rest columns have less than %15 missing values. For the numerical missing values, we will use imputing techniques to replace them. Since most of our columns have boolean type of variables we will implement pd.get_dummies() function to create dummy variables for all 0, 1 and NaN values. Thus we will not loose any data points.

Imputing the numeric columns

```
df['STDs (number)'].fillna(np.ceil(df['STDs (number)'].mean()), inplace=True)

df['IUD (years)'].fillna(np.ceil(df['IUD (years)'].mean()), inplace=True)

df['Hormonal Contraceptives (years)'].fillna(np.ceil(df['Hormonal Contraceptives (years)'].mean()), inplace=True)

df['Smokes (packs/year)'].fillna(np.ceil(df['Smokes (packs/year)'].mean()), inplace=True)

df['Smokes (years)'].fillna(np.ceil(df['Smokes (years)'].mean()), inplace=True)

df['Number of sexual partners'].fillna(np.ceil(df['Number of sexual partners'].mean()), inplace=True)

df['Number of sexual partners'].fillna(np.ceil(df['Num of pregnancies'].mean()), inplace=True)

df['Star (partners) (star (np.ceil(df['Num of pregnancies'].mean()), inplace=True)
```

pd.get_dummies() function for categorical missing values

```
df2 = pd.get_dummies(df[['Smokes', 'Hormonal Contraceptives', 'IUD', 'STDs','STDs:cervical condylomatosis','STDs:condylomatos

'STDs:vulvo-perineal condylomatosis','STDs:syphilis','STDs:Hepatitis B','STDs:pelvic inflammatory di

'STDs:molluscum contagiosum','STDs:AIDS', 'STDs:HIV','STDs:HPV']], dummy_na = True)

df2.head()
```

1 df.head()

	Age	Number of sexual partners	First sexual intercourse	Num of pregnancies	Smokes (years)	Smokes (packs/year)	Hormonal Contraceptives (years)	IUD (years)	STDs (number)	STDs: Number of diagnosis	 STDs:molluscum contagiosum_1.0	STDs:molluscum contagiosum_nan

5 rows x 64 columns

4

Data set consists of numeric data points solely.

1 df.info()

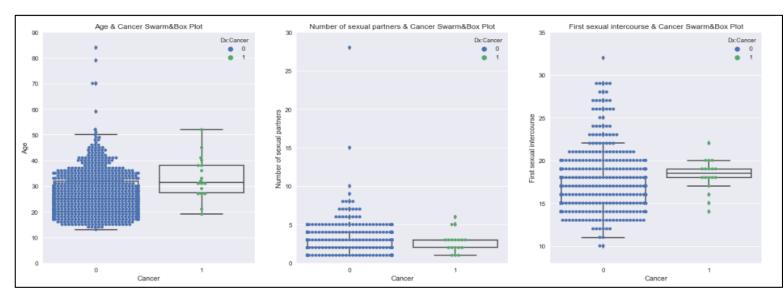

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 858 entries, 0 to 857
Data columns (total 64 columns):

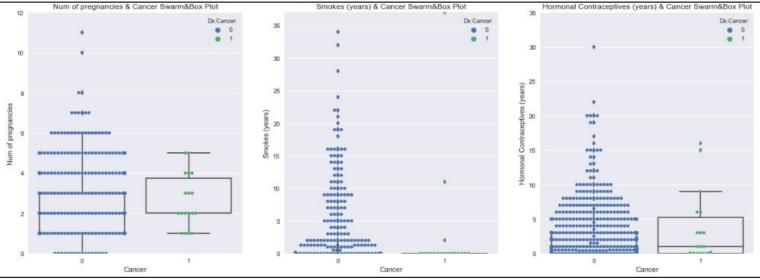

To save it as a csv file.**

1 df.to_csv('Cervical_Cancer_Risk_Cleaned.csv')

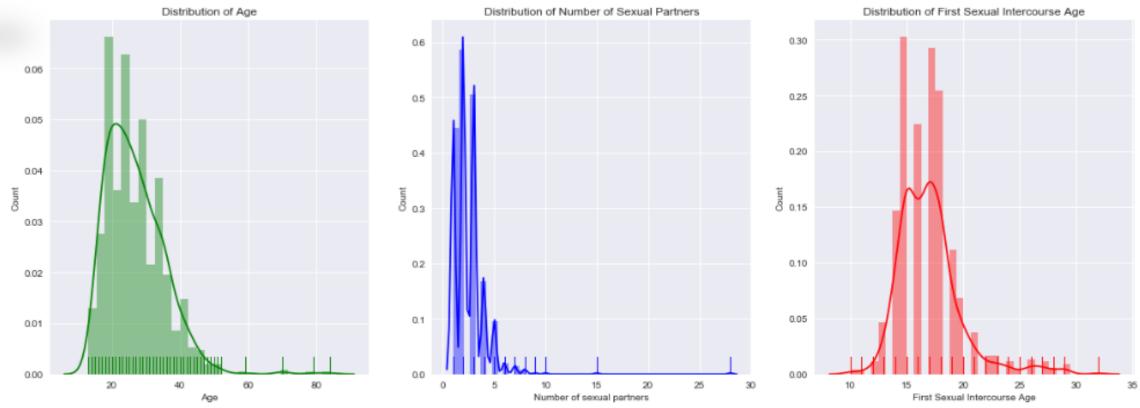

- ✓ Cancer diagnosed patient's age are cumulated between 27 to 42. Cancer patient's median age is higher than non-cancers.
- ✓ Cancer diagnosed patient's number of sexual partners are cumulated between 1 to 5. Most of the patients have had either 5 or less partners.
- ✓ Cancer diagnosed patient's first sexual intercourses are cumulated between 17 to 20.There is outlier even at 10. Cancer patient's median first sexual intercourse age is higher than non-cancer ones.
- ✓ Cancer patient's median number o pregnancies is higher than non-cancer.
- ✓ Most of the patients are not cancer smoke more than 3 years as well.
- ✓ Most of the non-cancer patients use hormonal contraceptives.

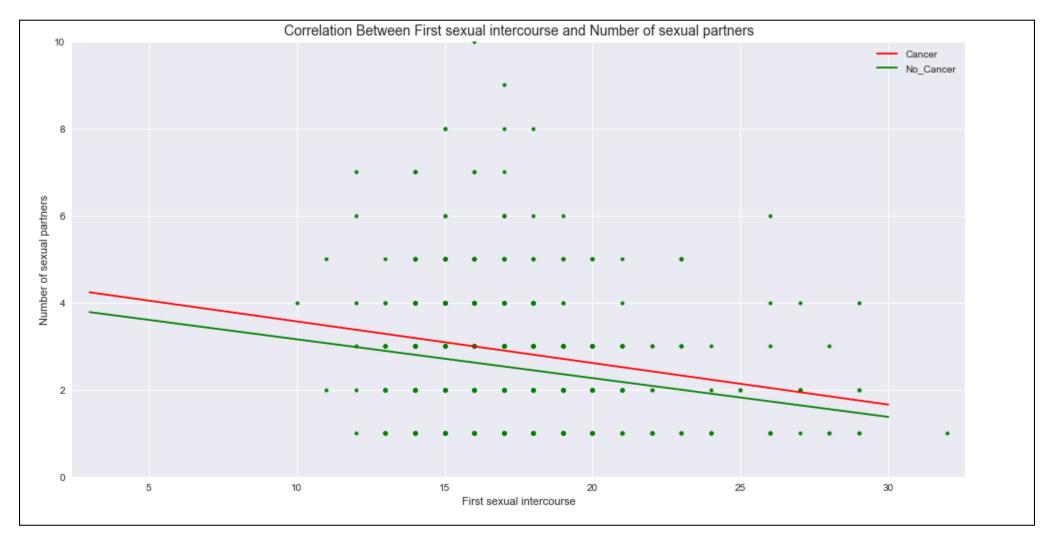

All three distributions looks like normal but skewed to right. On the middle plot there is only one outlier which is shown below.

df[df['Number of sexual partners'] > 25]

	Age	Number of sexual partners	First sexual intercourse	Num of pregnancies	Smokes (years)	Smokes (packs/year)	Hormonal Contraceptives (years)	IUD (years)	STDs (number)	STDs: Number of diagnosis	 STDs:molluscum contagiosum_1.0	STDs:molluscum contagiosum_nan	STI
467	16	28.0	10.0	1.0	5.0	5.0	0.0	0.0	0.0	0	 0	0	

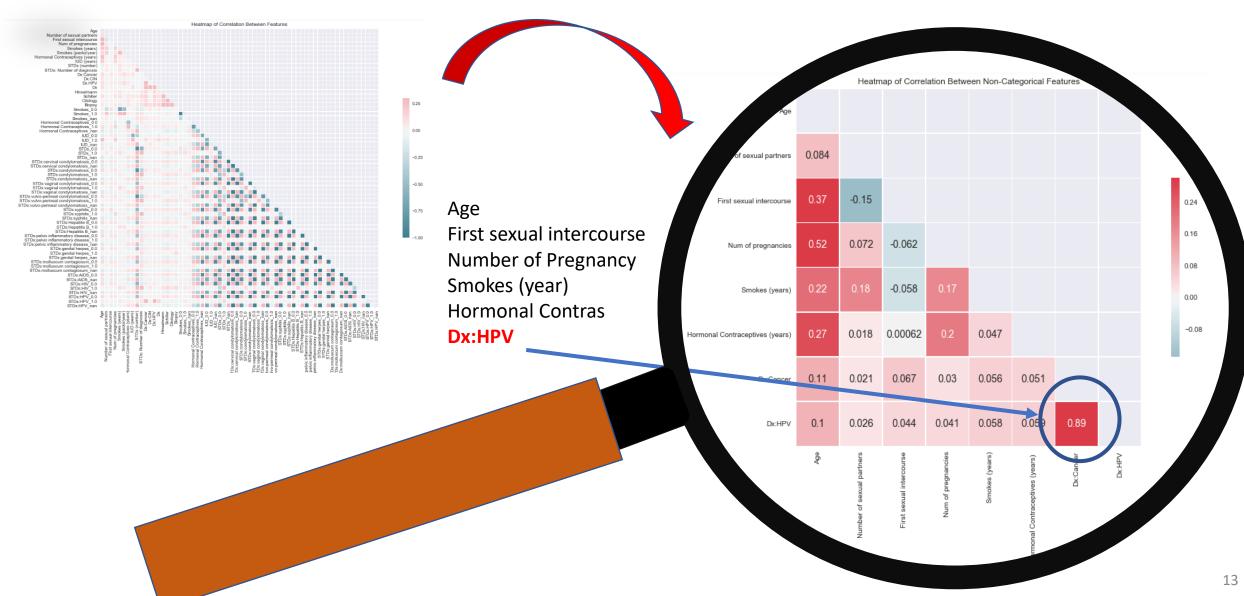

1 rows × 64 columns

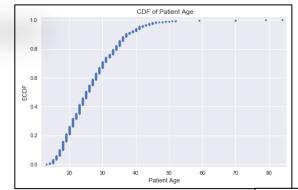

There is negative regression between First sexual intercourse and Number of sexual partners for both Cancer and Non-cancer diagnosed patients.

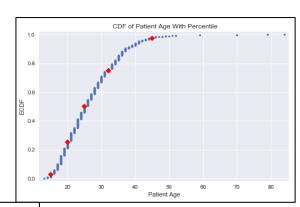

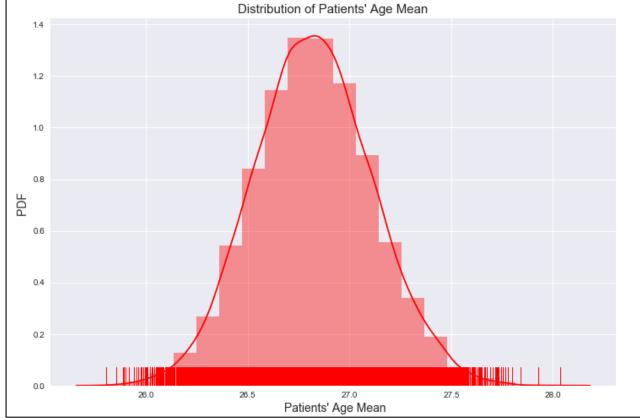

Normally Distributed

Based on the 95% confidence interval, ages between 26.6 and 27.9 are considered normal.

There is not enough
evidence that there is a
significant difference
between Cancer and NonCancer in average number of
sexual partners.

Conclusion

After changing the proportion of Train and Test Set, our model's prediction accuracy almost increased up to %6 and 6 out of 7 patients are also predicted as Cancer correctly. If we had more Cancer patient samples in data set, we would have train our model better and get more accurate predictions. To said that we would advise the customer to get more Cancer samples to have better predictions.
